

Melatonin-d3

<http://www.lumiprobe.com/p/melatonin-d3>

Melatonin-d3 is a deuterium-labeled stable isotopic analogue of the main pineal gland hormone, used as standards in NMR spectroscopy and mass spectrometry.

Melatonin takes part in the regulation of sleep, the activity of the endocrine system, circulatory and immune systems, and its pronounced antioxidant effect is also known. Replacing hydrogen atoms with its stable isotope, deuterium, allows absorption, distribution and metabolism to be determined in in vivo experiments [1]. The use of melatonin-d3 as a standard for mass spectrometry made it possible to accurately determine the melatonin content in biological fluids, such as blood plasma [2], urine [1], breast milk [3].

Structure of Melatonin-d3

General properties

Appearance: gray solid

Molecular weight: 235.30

CAS number: 90735-69-6

Molecular formula: C₁₃H₁₃D₃N₂O₂

IUPAC name: N-(2-(5-methoxy-1H-indol-3-yl)ethyl)acetamide-2,2,2-d3

Solubility: Acetonitrile, DMSO

Quality control: NMR ¹H and HPLC-MS (95+ %, D: 98+ %)

Storage conditions: 24 months after receipt at -20°C in the dark. Transportation: at room temperature for up to 3 weeks. Desiccate.

Legal statement: This Product is offered and sold for research purposes only. It has not been tested for safety and efficacy in food, drug, medical device, cosmetic, commercial or any other use. Supply does not express or imply authorization to use for any other purpose, including, without limitation, in vitro diagnostic purposes, in the manufacture of food or pharmaceutical products, in medical devices or in cosmetic products.
